“Angel One: A Case Study on Mobile-Based Stock Trading and Investor Behaviour”

Introduction

The financial services industry in India has undergone a significant transformation with the rapid development of **Financial Technology (FinTech)** and digital platforms. Technology has changed the way individuals access banking, payments, insurance, loans and investment services. Among these developments, the emergence of **mobile investment applications** has become one of the most important changes in the Indian financial market. Mobile applications have provided investors with a convenient and efficient method of accessing stock markets and mutual funds without depending entirely on traditional investment channels.

The article **"Mobile Applications: Future of Mode of Investment in Stocks and Units of Mutual Funds in India"** highlights the growing importance of mobile applications in the Indian investment environment. The increasing use of smartphones, affordable internet services and digital financial infrastructure has created favourable conditions for the expansion of mobile-based investment. Investors can access financial information, monitor market movements and perform investment transactions from almost anywhere. This development has made investment more accessible to individuals who may previously have found the traditional investment process complicated or inconvenient.

Traditionally, investment in stocks and mutual funds involved considerable dependence on stockbrokers and financial intermediaries. Investors often had to visit offices, complete physical documentation and rely on intermediaries for market information and transaction execution. The digital transformation of financial services has significantly reduced these barriers. Today, mobile applications allow investors to complete many activities through a single digital platform, including account opening, identity verification, buying and selling securities, mutual fund investment, portfolio monitoring and accessing market-related information.

The development of **online stock trading platforms** has also contributed to the growth of retail participation in India's capital market. Retail investors can now participate in the stock market with greater convenience than in the past. Digital platforms have introduced simplified interfaces and technology-based tools that help users monitor their investments. This has particularly created opportunities for younger and digitally connected individuals to become participants in the investment market.

In this changing environment, **Angel One** provides an important example of how FinTech is influencing investment services. As a technology-driven stockbroking and investment platform, Angel One uses digital channels to provide investment and trading facilities to its customers. Its mobile application represents the transition from conventional brokerage

services towards a more technology-oriented model of investment. Through digital services, investors can access market-related information and manage their investment activities through their smartphones.

One of the major advantages of mobile investment applications is **convenience**. Investors no longer need to be physically present at a broker's office to place an order or obtain basic information about their investments. Mobile applications provide access to investment services at any time, subject to market and service availability. This convenience can encourage individuals to take a more active interest in financial planning and investment.

Another important development is the **availability of real-time information**. Stock market investment is highly dependent on information, and mobile applications allow investors to receive market updates, price movements, portfolio information and other financial data through digital platforms. Easy access to information can help investors make more informed decisions, although the quality of an investment decision ultimately depends on the investor's financial knowledge and understanding of market risks.

Mobile applications have also contributed to the **digitalisation of the mutual fund investment process**. Earlier, investors commonly depended on distributors and physical documentation to initiate mutual fund investments. Digital platforms have simplified several steps involved in the investment process and made it possible for users to explore and manage mutual fund investments through mobile devices. This has increased the potential for mutual funds to become more accessible to technology-oriented investors.

The growth of mobile investment platforms is closely connected with **changing investor behaviour**. Easy access to investment information and trading facilities can influence how frequently investors monitor their portfolios and respond to market movements. Younger investors, in particular, may prefer mobile applications because they are already familiar with digital services. Social media, online financial content and digital awareness have further increased interest in investment among younger sections of society.

However, the growth of mobile investment applications also creates several challenges. Greater accessibility does not automatically mean that investors possess adequate financial knowledge. Investors may make decisions based on incomplete information, short-term market movements or social media trends. The ease of executing transactions may also encourage frequent trading. Therefore, **financial literacy and responsible investment behaviour** are important components of the digital investment ecosystem.

Cybersecurity and data privacy are additional concerns associated with mobile-based financial services. Investment applications handle sensitive personal and financial information, making the protection of customer data an important responsibility. Strong authentication, secure technology infrastructure and awareness among users are essential for maintaining trust in digital investment platforms.

Another important issue is **market risk**. Mobile applications make it easier to participate in financial markets, but they cannot eliminate the risks associated with investments. Stock prices can fluctuate significantly, and investors may experience losses. Therefore, the convenience provided by digital platforms should be accompanied by proper knowledge about risk, diversification, investment objectives and long-term financial planning.

The growth of FinTech has also increased competition within India's brokerage and investment industry. Companies are increasingly focusing on user experience, technology, pricing, research tools and digital services to attract and retain customers. This competitive environment encourages investment platforms such as Angel One to continuously improve their digital offerings and adopt new technologies.

The future of mobile-based investment is likely to involve technologies such as **Artificial Intelligence (AI), machine learning, data analytics, automation and personalised financial services**. These technologies can potentially help platforms provide more customised information and digital tools to investors. However, technology should complement rather than replace investor education and responsible financial decision-making.

Therefore, the study of **Angel One in the context of mobile investment applications** is relevant to understanding the broader transformation taking place in India's financial market. Angel One provides a useful case for examining how technology can change the traditional stockbroking model, improve accessibility and influence retail investment behaviour.

This case study, therefore, focuses on **"Impact of Mobile Investment Applications on Investor Behaviour: A Case Study of Angel One."** It aims to understand how mobile applications are changing the way Indian investors participate in stocks and mutual funds, the benefits offered by digital investment platforms, the factors influencing investor adoption, and the challenges associated with mobile-based investing. The study also examines the future role of mobile applications in creating a more accessible, technology-driven and investor-oriented financial ecosystem in India.

Objectives of the Study

1. To **study the growth of mobile-based stock trading in India** and understand how digital platforms have changed the traditional investment process.
2. **To examine the role of Angel One in digital stock trading** and understand how the platform enables investors to access financial markets through mobile technology.
3. **To identify the major features of the Angel One mobile application**, such as real-time market information, trading facilities, portfolio monitoring, research tools and digital account services.
4. **To analyse investor behaviour while using mobile trading platforms**, particularly with regard to trading frequency, investment choices, risk-taking and decision-making.

Review of Literature

Anand and Abhilash (2022) studied investors' behavioural intention towards trading applications in India. Their study found that **efficiency, convenience and perceived risk** influence investors' intention to use mobile trading applications.

Vijaya Kumar and Harish Babu (2023) examined investor preferences towards mobile stock-trading applications. The study highlighted the importance of **information availability, perceived benefits, attitude and ease of trading** in selecting mobile trading platforms.

Sonkar et al. (2023) studied the adoption of mobile trading applications among retail investors in India. The study found that **convenience, technological usefulness and perceived risk** play an important role in mobile trading adoption.

Gupta (2024) examined risk perception in mobile stock trading and found that **information quality, privacy and security** influence investors' willingness to adopt digital trading platforms.

Patel (2024) studied the impact of stock-trading mobile applications on investment decisions. The study showed that **convenience, user experience and confidence** can influence investors' decision-making.

Sravani and Vijaya Lakshmi (2026) studied online share-trading platforms and investor behaviour with particular relevance to **Angel One**. Their study highlighted the importance of **market information, usability, execution speed and analytical tools** in investor engagement.

Vatharkar et al. (2026) examined investor satisfaction with mobile stock-market applications, including Angel One. The study identified **ease of use, security, reliability, transaction speed and transparency of charges** as important factors affecting satisfaction.

ushal, Bhullar and Kumari (2026) examined the adoption behaviour of young investors towards mobile trading applications in India. The study found that

performance expectancy, facilitating conditions and financial literacy influence the use of mobile trading applications.

Princy, Gunavarthani and Samyuktha studied fintech adoption and trading behaviour among retail investors in India. Their research indicated that **low brokerage charges, real-time information and app notifications** can influence investors' trading habits.

Assessment of Users' Adoption Behaviour (2023) examined the adoption of online stock-market investment applications in India. The study identified **awareness, reliability, safety, financial literacy, perceived risk and technical factors** as important determinants of investors' adoption behaviour.

Company Profile – Angel One

Angel One Limited is an Indian financial services company that operates as a technology-driven stockbroking and investment platform. It provides digital access to financial markets through its mobile application and online platforms. The company represents the transformation of traditional stockbroking into a technology-oriented model where investors can manage their investments using smartphones.

Angel One enables customers to participate in financial markets by providing facilities for stock trading, mutual fund investments, portfolio monitoring, market information and other digital investment services. Its mobile-based approach reduces the need for investors to physically visit a broker's office and allows them to perform many investment-related activities through a single digital platform.

Business Model

Angel One follows a **technology-driven digital brokerage business model** that provides investors with convenient access to stock-market and investment services through its mobile application and online platform. The company has shifted traditional brokerage activities toward a digital environment, allowing customers to open accounts, complete identity verification, buy and sell securities, invest in mutual funds, monitor portfolios and access market-related information through digital channels. Its business model focuses mainly on convenience, accessibility, technology and user experience. By using mobile technology, Angel One can serve retail investors without depending entirely on physical brokerage offices. The platform is particularly useful for younger and digitally connected investors who prefer managing their investments through smartphones. The company's digital model also uses research tools, real-time information and analytical features to support investors in their decision-making.

Revenue Model

Angel One's **revenue model** is primarily connected with the financial and investment services provided through its digital platform. The company can generate revenue through brokerage and transaction-related charges associated with eligible trading activities, along with income from various investment and financial services offered to customers. Its digital platform enables the company to handle a large volume of customer transactions efficiently while reducing dependence on traditional physical infrastructure. The availability of services such as stock trading, mutual fund investment, research facilities and other investment-related features creates opportunities for generating service-based income. As the number of users and their engagement with the platform increase, transaction activity can also contribute to the company's revenue generation. Therefore, Angel One's revenue model is closely linked to its technology-based platform, customer base, trading activity and range of financial services.

SWOT Analysis of Angel One

SWOT analysis is a strategic tool used to evaluate the **Strengths, Weaknesses, Opportunities and Threats** of an organisation. It helps in understanding the internal capabilities of a company as well as the external factors that may influence its performance and growth. In the case of **Angel One**, SWOT analysis is useful for examining how its technology-driven mobile investment platform has changed the traditional stockbroking model and influenced investor participation. Angel One provides digital facilities for investment and trading, including access to market information and portfolio management through smartphones.

Strengths

1. **Strong digital platform** – Angel One uses mobile and online technology to provide investment and trading services conveniently.
2. **Easy accessibility** – Investors can access investment services through smartphones without depending entirely on physical brokerage offices.
3. **Real-time information** – Users can receive market updates, price movements and portfolio information through the platform.
4. **Convenient trading** – Customers can perform various investment activities digitally, making the process faster and more convenient.
5. **Wide range of digital services** – The platform supports activities such as stock trading, mutual fund investment and portfolio monitoring.

6. **Attractive to young investors** – Younger and digitally connected individuals may prefer mobile applications because they are already familiar with digital services.

Weaknesses

1. **Dependence on technology** – The platform depends heavily on digital systems and reliable technology.
2. **Cybersecurity concerns** – Investment applications handle sensitive personal and financial information, making data protection important.
3. **Dependence on internet connectivity** – Customers require internet access and suitable devices to use mobile investment services.
4. **Limited financial knowledge among some users** – Easy access to trading does not automatically ensure that investors understand financial risks.
5. **Risk of frequent trading** – The convenience of mobile applications may encourage some investors to respond frequently to short-term market movements.

Opportunities

1. **Growth of mobile investing** – Increasing use of smartphones and digital financial services provides opportunities for further growth.
2. **Increasing retail participation** – Digital platforms can encourage more individuals to participate in India's capital markets.
3. **Artificial Intelligence** – AI can support personalised investment information and digital financial tools.
4. **Data analytics** – Advanced analytics can help provide investors with better information and customised services.
5. **Expansion among young investors** – Growing interest in digital financial services among younger consumers provides an opportunity for customer expansion.
6. **Improved financial education** – Angel One can use its digital platform to promote investor education and responsible investment behaviour.

Threats

1. **High competition** – The growth of fintech has increased competition among brokerage and investment platforms. Companies compete through pricing, technology, user experience and research tools.
2. **Cybersecurity threats** – Cyberattacks and data-security problems can affect customer confidence.
3. **Market volatility** – Changes in stock prices can result in significant losses for investors.

4. **Changing investor behaviour** – Investors may make decisions based on short-term market movements or social-media trends.
5. **Regulatory challenges** – Changes in financial-market rules and regulations may affect digital brokerage operations.
6. **Technology-related risks** – Technical problems or interruptions can affect customers' ability to access investment services.

Findings

1. **Angel One has transformed traditional stockbroking into a digital model** by providing investment and trading services through mobile and online platforms.
2. **Mobile accessibility has made investment more convenient** because investors can open accounts, complete verification, trade securities and monitor their portfolios digitally.
3. **The platform provides multiple financial services**, including stock trading, mutual fund investment, portfolio monitoring and market information.
4. **Angel One's revenue is connected with trading and financial services**, including brokerage and transaction-related charges and other service-based income.
5. **Real-time market information supports investor activity** by providing price movements, market updates and portfolio information through the digital platform.
6. **The platform is particularly accessible to young and digitally connected investors**, as mobile applications fit their existing digital habits.
7. **Technology dependence is an important weakness**, as users require reliable digital systems, internet connectivity and suitable devices to access investment services.
8. **Easy access to trading does not necessarily mean strong financial knowledge**. Investors may require greater awareness of investment risks and responsible investment practices.
9. **Digital investing provides opportunities for future growth** through mobile investing, retail participation, artificial intelligence, data analytics and investor education.
10. **Investor behaviour can be influenced by digital and social-media trends**, while market volatility, cybersecurity issues, competition and regulatory changes remain important challenges.

Conclusion

Angel One demonstrates how technology and mobile applications have changed the traditional stockbroking and investment environment. Its digital platform provides investors with

convenient access to stock trading, mutual funds, portfolio monitoring and market information. By reducing dependence on physical brokerage offices, the platform makes investment activities more accessible to individuals who prefer using smartphones and online services.

The study shows that mobile-based stock trading can improve convenience, accessibility and speed in investment activities. Real-time information and digital tools allow investors to monitor market movements and manage their investments through a single platform. This technology-driven approach is also relevant to younger and digitally connected investors who are increasingly comfortable with mobile financial services.

At the same time, the study identifies certain challenges associated with digital investment platforms. Dependence on technology and internet connectivity can affect accessibility, while cybersecurity and data protection are important concerns because investment platforms handle sensitive financial information. Easy access to trading may also encourage frequent trading among some investors, particularly when they react to short-term market movements or social-media trends.

Angel One also has opportunities to expand through the growth of mobile investing, increasing retail participation, artificial intelligence, data analytics and financial education. However, competition among fintech and brokerage platforms, market volatility, cybersecurity threats, regulatory changes and technological interruptions can influence its operations.

Overall, the case study indicates that Angel One represents the growing role of **mobile technology in stock trading and investor participation**. Its digital business model has made investment services more accessible and convenient, while also highlighting the importance of financial knowledge, responsible investment behaviour, cybersecurity and technological reliability.
